

SECURITY ANALYSIS

Contents

1	Introduction	3
2	Phase 1 – Basic Website vulnerability scanner	3

1 Introduction

This project aims to create a service that analyzes the security of diverse elements. The implementation is divided in many phases, using iterative development in order to learn and implement new features and technologies step by step.

The final goal would be to create a full-stack security analysis service, capable of giving complete reports of the security of a given system, including but not limited to: web applications, network services, and software applications. The target audience would be enterprises, small startups and individuals that want to analyze the security of their systems and applications.

Through this project, I aim to develop my cybersecurity skills, as well as my overall programming skills in full-stack. I'm also planning to deploy the service in a cloud environment, thus learning about cloud computing and deployment. Additionally, in much later phases, I would also like to add monetization features and build a small startup/enterprise around it. This last part is still in the optic of learning in the sense that many similar services probably exist and my chances of making concrete profit are really low.

To conclude this introduction, I hope this project will see the light of day as a real service. I will do my best to document each phase, not only for me but also for anyone that might read this in the future and is curious about the insights of the building process of this service (instead of only having the classical README file).

2 Phase 1 – Basic Website vulnerability scanner
